The Rotator System

How We Wants It Built – Step by Step

1. Start With the Right Mindset

Before building anything, we are clear about one thing:

This is **not just a QR code system**.
This is **not a shop directory**.
This is **not a static webpage**.

It is:

> A controlled, rotating advertising system for the high street.

The purpose is to:

- Help local businesses make money.
- Centralise marketing control.
- Automate engagement.
- Keep customers discovering new offers.
- Make it simple for business owners.

Everything must be built around that idea.

2. The QR Code Is Only the Trigger

We makes this very clear:

The QR code does not decide what to show.

It only:

- Starts the process.
- Connects the user to the system.

So when someone scans a QR code:

It must NOT open:

- One fixed page.
- One fixed offer.

Instead, it must open:

- The Rotator system.

This is the first build rule.

3. The Rotator Must Show Offers in Order

We compare this to a long split test.

Here's how it must work:

1. The system keeps a list of offers.
2. The system remembers which offer was shown last.
3. When a new scan happens:
    - It shows the next offer in the list.
4. After showing it:
    - It moves forward in the list.

Example:

If there are 100 offers:

- Scan 1 → Offer 1
- Scan 2 → Offer 2
- Scan 3 → Offer 3
- ...
- Scan 100 → Offer 100
- Scan 101 → Back to Offer 1

It keeps rotating forever.

That is the core of the system.

4. The System Must Remember Where It Is

This is critical.

The system must:

- Remember the last offer shown.
- Move forward each time.
- Not repeat the same offer unless the list has finished.

This memory must work even if:

- 100 people scan at the same time.
- Thousands of people scan per day.

It must not:

- Crash.
- Reset randomly.
- Show blank pages.

It must always show something.

5. The High Street Must Be Controlled Centrally

We do not want:

- Each shop controlling their own QR page.
- Each shop doing their own marketing.
- Each shop competing in isolation.

Instead:

The entire street becomes one connected system.

That means:

- All offers are placed into one controlled rotation.
- 247 controls the sequence.
- 247 decides structure.
- Business owners plug into it.

This is not optional.

6. Storefronts Are Digital Billboards

We describe shop windows as billboards.

That means:

A storefront is not:

- A personal website.
- A custom marketing playground.

It is:

A controlled advertising panel.

When someone scans:

- The Rotator chooses the offer.
- The storefront displays it inside a fixed layout.

The layout must:

- Be clean.
- Be simple.
- Show the offer clearly.
- Show a call-to-action.
- Show branding.

The business does not redesign this.

7. There Must Be Levels of Control

We mention platinum level access.

So the system must allow:

Level 1 – Basic

- 247 controls the offer.
- The business submits a deal.
- Or 247 assigns one.

Level 2 – Premium

- The business can:
  - Feature their offer temporarily.
  - Book priority placement.
  - Control their storefront for a limited time.

After that period ends:

- The system returns to rotation automatically.

Overrides must expire.
Nothing permanent.

8. The System Must Support Seasonal Campaigns

We do not want:

- Business owners remembering dates.
- Manual seasonal switching.
- Confusion.

So the build must include:

- Predefined seasons (Winter, Spring, Summer, Autumn).

- Preset date ranges.
- Automatic switching.

When winter starts:

- Winter offers show.
- Summer offers stop.

No manual switching required.

This must be preset by 247.

9. The Business Owner Must Do Almost Nothing

We repeat this principle:

> "I don't want the business owner doing anything."

So the build must:

- Reduce settings.
- Remove complex options.
- Avoid marketing decisions.

Business owners should:

- Plug in.
- Approve their deal.
- Let it run.

This is a 90% done-for-you system.

10. The System Must Be Simple to Understand

If it needs explaining, it isn't finished.

So:

- The admin area must be obvious.
- No complicated wording.
- No confusion.
- No training dependency.

If admin logs in and asks:
"What does this mean?"

Then it must be improved.

11. It Must Never Show a Blank Page

If:

- An offer expires.
- An offer is missing.
- A business forgets to submit one.

The system must:

- Skip to the next active offer.
- Or show a default branded fallback offer.

Never:

- Error page.
- Empty page.
- Technical failure message.

Always show something valuable.

12. The System Must Track Everything

Even though it is simple to the user, it must track:

- How many scans.
- Which offer was shown.
- Which offer was clicked.
- Which offers perform best.

We call feedback “gold dust”.

So data must be collected for:

- Optimisation.
- Campaign improvement.
- Seasonal refinement.

13. Traffic Is Not the Focus

We don’t need to obsess about traffic.

Because:

The engagement comes from:

- Physical location.

- Incentives.
- Curiosity.
- Mobile convenience.

So the build must focus on:

- Incentive quality.
- Rotation fairness.
- Simplicity.

Not traffic hacks.

14. Branding Must Be Built Into the System

Every offer shown must also:

- Reinforce brand identity.
- Reinforce MCOM presence.
- Build recognition.

Brand building is not separate.
It is embedded in every storefront display.

15. This Must Work Like a Machine

> A machine.
> A robot.

That means:

- It runs automatically.
- It does not need manual babysitting.
- It does not depend on daily intervention.
- It keeps generating engagement.

Once set up:
It should run continuously.

16. The Final Goal

We believe this one system:

- Can generate passive income.

- Can control the high street.
- Can remove dependence on third-party marketplaces.
- Can create a new form of high street e-commerce.

This is not a feature.

It is the engine of the business.

Final Summary

We want the Rotator system built as:

1. A QR-triggered sequential offer system.
2. Controlled centrally by 247.
3. Rotating through all participating businesses.
4. Automatically resetting when it reaches the end.
5. Supporting seasonal switching.
6. Allowing temporary premium overrides.
7. Showing offers inside fixed storefront templates.
8. Never showing blank pages.
9. Requiring almost no effort from business owners.
10. Tracking all engagement data.
11. Being completely simple and clear.
12. Operating automatically like a machine.
